"Thank you!" "Damn it!" "It really burns!" "Look at your head!" "What are you doing?" "I want you to keep on talking!" "You still don't realize you have to keep on talking." "Miu!" "You have to eat well for the baby." "You have to keep on talking!" "The baby is still making milk for your baby's needs." "What?" "!" "What is this?" "!" "Didn't you feel that?" "!" "You should start gathering energy to eat the energy to keep on talking." "You have to keep on talking." "Hua, you'll go to the ceremony again?" "You didn't tell me you wanted to come." "I'll go back to work." "I'm not going." "But you have to go!" "Hua." "Hua..." "Do you still want to go to the ceremony?" "Hua." "Hua." "Hua..." "Hua, Hua..." "Hua." "Hua..." "Hua!" "Miu..." "Miu..." "My dear!" "My dear!" "Miu!" "What the heck is this?" "!" "It's so big!" "Hua, Hua..." "My dear!" "You're not crying..." "My dear!" "Miu!" "Miu!" "My dear!" "Miu!" "Miu..." "Miu!" "You're having a son!" "I'm having a son!" "I'm having a son!" "My dear!" "I'm having a son!" "I'm having a son!" "Miu!" "Miu!" "Miu!" "Miu!" "Miu!" "Miu!" "Hua..." "Miu!" "I'm having a son!" "Hua, Hua, Hua!" "Hua, Hua, Hua!" "My dear..." "My dear..." "Miu!" "Miu!" "Miu!" "Miu!" "My dear..." "My dear..." "My dear!" "I'm having

Determination of mycophenolic acid in pharmaceutical dosage forms by HPLC with a variable wavelength UV-vis detector. A simple, efficient and accurate reverse-phase high-performance liquid chromatographic (HPLC) method for the determination of mycophenolic acid (MPA) is described. The method was based on the retention behavior of MPA and the separation of its external standard, nifurtimox, on a C(18) column using methanol-0.1 M sodium acetate buffer (50:50, v/v) as mobile phase at a flow rate of 1.5 mL/min, monitored at 240 nm. The calibration curve was linear in the range 1.5–40 microg/mL, the accuracy of the method was 100.9+/-0.3% (n=6), the intra- and interday relative standard deviations of the peak area of the analyte were 3.3 and 1.7% (n=6), respectively. The method was successfully applied to determine MPA in four tablet formulations containing different percentages of MPA and in different pharmaceutical dosage forms without any interference of the excipients or degradation of the drug. Recently, full-featured composite materials have been developed which consist of a thin layer of carbon or diamond (i.e., "diamond-like" carbon) bonded to an underlying solid material such as steel or copper. The use of such composite materials in industry is still in its infancy and is limited primarily to special applications where low weight and high toughness are desired
