It must be 7-40 characters, and the first 6 or 7 characters must be the alpha characters A-Z and/or the numeric 0-9. Keymacro can also be configured to store the following information: . This is the most common configuration for users. . This is the preferred configuration for users, because any user with the "admin" role can modify this configuration. If you're using Perforce, you should be using the /src/main/resources/etc/perforce.cfg for your environments configuration. SVN SVN: Subversion SVN is the ideal version control system for open source projects and enterprise-class code. SVN Source Code Management (SCM) is a version control system (VCS) similar to Subversion, but more actively developed. As well as being a source code repository, SVN can be used as a component of a build tool such as Ant or Maven and is integrated into many Integrated Development Environments (IDEs). If you are using Perforce, the recommended approach is to have the Perforce installation and associated configuration files on the server but the Perforce client on the workstation. Perforce configuration files are located in /src/main/resources/etc/perforce.cfg and should be updated with the latest configuration settings for your organization. A: In addition to the other answers, the use of a centralized Perforce repository does not address the other security issues which are related to the use of software. A locked down machine is still a locked down machine. The software is the key to the security of the system. So, for example, if you have a phone or a laptop that contains information which is not classified (which is not the situation here), a locked down box is not secure. It might be secure in your terms of what I am describing, but in the eyes of a knowledgeable attacker it is not secure. I am not trying to speak against the use of Perforce or any software. I do understand the need for collaboration and version control, and the security issues with maintaining a very locked down machine. There is no easy solution 70238732e0
