The analysis will consider both small systems and large systems. The purpose of the study is to provide a theoretical foundation for the metastable crystallization of polymers and to examine the possibility of controlling the nucleation process through manipulation of experimental parameters. The basic model of a nucleation phenomenon in a metastable liquid is treated. The models is then refined to include the rate process of nucleation. The theoretical analysis will be supported by computer simulations of the spontaneous nucleation of a solid phase in a metastable liquid. The theory will examine the role of dimensionality in nucleation. The effects of patterning and geometry of nucleation will be considered. The theory will also be used to analyze experimental results.Targeted expression of TRPC3 in vascular smooth muscle cells promotes the progression of vascular lesion. Transient receptor potential channel cation subfamily C, member 3 (TRPC3) is a member of TRPC channel and participates in cardiovascular system regulation. However, it remains unclear whether and how TRPC3 affects vascular lesion. The aim of the present study is to investigate the role of TRPC3 in vascular lesion. We first constructed a TRPC3 overexpression plasmid and measured the protein expression of TRPC3 in vascular smooth muscle cells (VSMCs) as well as TRPC3 expression in different types of vascular lesions. The proliferation, migration, and apoptosis of VSMCs were measured after TRPC3 overexpression. Lastly, we performed a cell-based migration assay to assess the proliferation and migration of TRPC3 overexpressing vascular cells. The results showed that TRPC3 expression was greater in the vascular lesion than that in the normal aorta. TRPC3-overexpressing VSMCs showed increased cell proliferation and migration compared with control cells, indicating that overexpression of TRPC3 in ba244e880a
