have a taxonomy called colors, and I'm using the following code to get all of the posts with colors: ID, 'colors'); foreach(\$colors as \$color) { echo \$color->slug; } ?> I can only see the first result from this, but I'd like to get all of them. How can I do this?

A: You need to add a term for each of the colors, rather than only the last one (which it looks like you're doing). ID, 'colors'); foreach(\$colors as \$color) { echo \$color->slug; } ?> This does only one result. To get all of the results, you need to loop through your color list. ID, 'colors'); foreach(\$colors as \$color) { echo \$color->slug; } ?> The present invention relates generally to inkjet printing and, more particularly, to a method and apparatus for

electrostatic decoupling of nozzles of an inkjet printhead. Inkjet printing is a popular means of recording images on various media surfaces, including paper, textiles, and transparencies. In inkjet printing, an electronic signal controls the release of ink droplets from an array of nozzles in a printhead, and the droplets are deposited on print media to form desired printed images. An inkjet printer supplies ink to the printhead from a reservoir of ink, and the ink from the reservoir is regulated to provide desired amounts of ink to the printhead. The printhead typically includes a substrate, such as a silicon or other semiconductor material, with a plurality of channels for carrying ink to the nozzles. The nozzles are disposed over the
