The fungal genus Cladobotryum is a known cause of botulism. The infection involves the esophagus and is characterized by peristalsis. Botulism can be life-threatening if not properly identified and treated. The infection may present with diplopia, dysphagia, weakness, and blurred vision. A case of botulism that occurred in a patient with a corneal transplant is reported. The postoperative course of the patient was characterized by blurred vision, diplopia, and dysphagia. A diagnosis of botulism was made by demonstrating the presence of the botulinum toxin in a specimen of the patient's blood and in his esophagus. Symptoms resolved after treatment with antitoxin and supportive care.Q: Integer to String and Back? I've stumbled over a very strange behaviour of the String conversion. I can't tell if it's just an error in my program or if this is actually how Strings work: 123456 is a String, I know that. Javascript converts 123456 to "123456" when I alert or display the String. But when I convert "123456" back to a String with Number(123456); I get "1000" (!) Notice that it's the conversion in the other direction! Now if I convert the number string "1000" to a string with Number(1000); It is of

course "1000" again, as expected. Does anybody know why the String conversion is not symmetrical? Or have I made a big error somewhere? EDIT: I'm converting between the String and Number types when making calculations. Is there a chance that this may be the reason for this strange behaviour? A: String is immutable in JavaScript. You cannot reassign a string value. So when you do Number("123456");, it's like creating a new string with new String("123456"); A: but when i convert my own string - "1000" - to a string with "Number("1000");" i get " ba244e880a
