Field of the Invention This invention relates to ceramic electronic component, and more particularly to a ceramic electronic component of the type having a base and a plurality of external electrodes provided on the base, and to a method of manufacturing the same. 2. Description of the Related Art In recent years, with reduction in size and increase in capacity of electronic equipment, miniaturization and high functionality have been demanded for the electronic components used in the electronic equipment. With such demands, there has been an attempt to provide an electronic component with a base in a small size, and at the same time, to provide a plurality of external electrodes on the base. The base of such electronic component generally has a large

number of inner electrodes, each of which is arranged in a desired pattern and electrically connected with one of the external electrodes. The ceramic electronic component as described above, generally has the structure in which the base and the external electrodes are formed on the base in a multilayer structure. In the case of forming the base and the external electrodes in a multilayer structure, a conductive paste is printed on the base so that the conductive paste is interposed between the adjacent inner electrodes. The printed conductive paste is then heated and dried to form the external electrodes. When the base and the external electrodes are thus formed in a multilayer structure, it is possible to secure a large number of external electrodes on the base, each of which is arranged in a desired pattern. Ceramic electronic components with a base in a small size and with a large number of external electrodes arranged thereon, can be produced by the above-described method.

In the method, however, the conductive paste is interposed between the adjacent inner electrodes, and therefore, the conductive paste is likely to be exposed to the atmosphere. As a result, there is a problem that the outer layer of the external electrodes may be oxidized. The outer layer of the external electrode is electrically connected with the inner electrode which is to be formed by soldering. Since the inner electrode is interposed between the adjacent external electrodes, the outer layer of the external electrodes has a low heat-resisting property. Therefore, in the case 2d92ce491b
