We hope you find the tool helpful and if you have any questions, please contact us at License: Please refer to the original project page for more information about the license used.

ComPortNotifier [April-2022]

The app checks and notifies when you connect or disconnect a device via USB. It is a background utility that does not affect the system performance. The app is a simple application with a user-friendly interface. ComPortNotifier is not a full-fledged serial communication utility and will only check and notify when there is a physical connection between your USB port and COM port, such as connecting a printer, a mouse or USB modem (to name a few). Even if the device does not provide a COM port, such as pointing a USB camera at your laptop, the app will still work. However, you should note that some devices will not automatically provide an alternative COM port when it is connected. For example, all cameras that use a USB connection do not provide a COM port, which is why you cannot use a COM port for an Olympus camera. Key Features 1. Proven Technology - innovative free-hand mouse movements and window resizing, built-in high performance PureHarmonyTM voice analyzer, assistive and adaptive technology. 2. Usability - fast and fun entry to text, support for major languages 3. Tools - send and receive text messages, transfer text files, search the internet, add and run programs with notepad, save and open files, preview and convert image files, view and manage your emails 4. Please report any bugs you find to us for fixing or adding new features. 4. We are offering free technical support for 30 Days after purchase. 5. Our aim is to distribute free, useful and light-

What's New in the?

ComPortNotifier is a free Windows utility that helps you keep track of various data related to COM ports of your PC. When the COM port is present, it acts like a simple port device with sensible LED indicators, letting you know when the device is connected to a computer. How does it work? When you plug a serial device into your computer, ComPortNotifier reveals itself as a "Com port provider" to Windows. With that, you can immediately identify that the device is present on the computer. When you disconnect the device, ComPortNotifier does not detect the disconnection itself. It only shows you that the port was disconnected and that no data was transferred. In order to be notified about the connection/disconnection of a COM port, we used the standard Windows COM port notification service. There are many ways to use COM port notification, so you don't have to be part of the Windows update program (which is kind of self-explanatory). Apart from that, we added simple keyboard shortcuts, so that you don't have to use your mouse to manage your COM ports. It would be nice if we could pick up more data than just that the port is connected and disconnected, and the data you used to transfer. What can you do with it? With its two simple windows, ComPortNotifier lets you manage your COM ports at a first sight. You can enable or disable COM port notification services. This way, you can use ports that might not work with other applications and still get notifications. You can set the COM port notification hotkeys. You can use CTRL-D to show the current port data or CTRL-S to set a new data for a given COM port. You can customize the layout and color of the application. Why is it free? We released this application as free because it does not cost you any extra licenses or registration. It is also a piece of software that helps you make better use of your digital devices. Besides that, we also made it open-source in case we can improve its functionality and/or bugfixes. ScreenShot: Version History: v1.0 (10-07-2015): First release v1.2 (10-11-2015): Updated v1.5 (11-19-2015): Added ability to save COM port data to file v2.0 (05-18-2016):

System Requirements:

Graphics Card: Recommended system requirements are: DirectX 9.0c compatible GPU, and 1GB of RAM. Windows® XP, Vista® or Windows 7. DirectX9.0c compatible GPU: 512MB of dedicated video RAM DirectX® 9.0c 4.3 GHz CPU 1GB of RAM DirectX® 11: 1024MB of dedicated video RAM DirectX® 11 5 GHz+ CPU 6 GB of RAM Minimum: 1024MB of dedicated
