outcomes after femtosecond laser in situ keratomileusis for correction of refractive error. To evaluate the predictability, safety, and stability of spherical, spherical equivalent (SE), and astigmatism after femtosecond laser in situ keratomileusis (LASIK) and assess visual and refractive outcomes at 6 months. A prospective clinical study was conducted. Participants had eyes with no known ocular disease, a best-corrected visual acuity of 20/20 or better, an astigmatism of no more than 1.50 diopters, and a spherical refractive error of -3.00 to +4.00 D. Eyes were randomized into two groups: (1) a control group receiving the modified LASIK procedure (Group 1) and (2) a group receiving the modified LASIK procedure with preoperative and 6 months postoperative phacoemulsification and intracapsular lens implantation (Group 2). Uncorrected visual acuity (UCVA), uncorrected and spectacle-corrected distance visual acuity (UDVA and DCNVA), and refractive predictability. A total of 158 eyes were enrolled. At 3 months, 98% of eyes in Group 1 had a UCVA of 20/20 or better and 98% had a postoperative SE within ± 0.50 D of emmetropia. Refractive predictability was maintained to within ± 0.50 D of emmetropia in 98.7% of eyes. Two eyes in Group 1 and one eye in Group 2 had eyes reoperated for refractive error at 3 months. At 6 months, the UCVA and DCNVA were 20/20 or better in 94.8% of eyes in Group 1 and 100% in Group 2. UDVA and DCNVA were 20/20 or better in 94.9% and 100% of eyes in Group 1 and Group 2. Refractive stability was maintained in 96.3% of eyes in Group 1 and 100% of eyes in Group 2. SE was within ± 0.50 D of emmetropia in 98.7% of eyes in Group 1 and 99.4% in Group 2. Six months after LASIK, 94.8% of eyes had UCVA

KEYMACRO creates and saves a password for encryption and decryption of any file. Features: * Generates a random 10 character password * Generates a random 8 character password * Generates a random 6 character password * Encrypts (or decrypts) a file using a specific password * Save password to file * Import a password from a file * Import a password from the clipboard * Encrypts (or decrypts) a file using an existing password * Encrypts (or decrypts) a file using a password that was previously saved * Encrypts (or decrypts) a file using a password that was previously saved to a file * Encrypts (or decrypts) a file using a password that was previously saved to the clipboard * Decrypts (or encrypts) a file using a specific password * Decrypts (or encrypts) a file using a password that was previously saved to a file * Decrypts (or encrypts) a file using a password that was previously saved to a file * Decrypts (or encrypts) a file using a password that was previously saved to the clipboard * Decrypts (or encrypts) a file using a password that was previously saved to the clipboard * Reads an encrypted password from a file * Reads an encrypted password from the clipboard * Reads a password from the clipboard * Export the password to the clipboard * Import a password from the clipboard * Exports the password to the clipboard * Import the password from the clipboard * Encrypts (or decrypts) a file using the file's name * Encrypts (or decrypts) a file using the file's path * Encrypts (or decrypts) a file using the file's extension * Encrypts (or decrypts) a file using the file's contents * Encrypts (or decrypts) a file using the file's folder * Encrypts (or decrypts) a file using the file's modified date * Encrypts (or decrypts) a file using the file's created date * Encrypts (or decrypts) a file using the file's modified time * Encrypts (or decrypts) a file using the file's created time * Encrypts (or decrypts) a file using the file's owner * Encrypts (or decrypt 77a5ca646e

Enciphering Crack + With Full Keygen [Latest 2022]

Enciphering is an encryption software whose main function is to help you encode lines of text in order to protect their contents from other people. The application is rather difficult to work with, due to the poorly translated interface. As such, it can take quite a lot of 'trial and error' before you figure out how to use it properly. Enciphering features two parallel panels, 'The Text' and 'Code'. In the first, you can input the phrases or words you want to encode. You have the option of adding the contents from a TXT file, using the 'To Open' button. This needs to be at least 30 characters long, otherwise the program refuses to encypher it. Similarly, in the 'Code' window, you can enter the encryption key you want to use, which also requires a minimum of 30 characters. These can be anything from upper and lower case letters, to numbers or special characters, and it too can be entered from a pre-existing TXT. When you are done, you can press the 'To Cipher' button, which will encrypt your text into a string of numbers, that can only be decyphered by using the initial 'Code'. It is generally recommended that you use a longer code, as its length seems to be directly correlated with the strength of the provided protection. By pushing the 'To Keep' button, you can save the encoded contents to a TXT file. Moreover, an already encrypted text can be re-encrypted several times, using the same 'Code' or a different one, thus ensuring an increased level of security. If however, you want to decrypt a text that was encoded using Enciphering, you can enter its contents along with the used 'Code', then press the 'To Decode' button. Enciphering is an interesting tool that can prove quite useful, as it allows you to encode extensive amounts of text using a 'Code' of your contrive, similar to a password working as an encryption and decryption algorithm. However, it could use some improvements concerning the translation of its interface and its 'Information' file, because this might discourage some people from using it. To Encipher/Decipher text: Click on 'Text' or 'Code' to open the respective windows. Enter the text you want to Encipher in the 'Text' window. You can do this by typing it, or using the 'To Open' button. Enter the Code in the '
