Publication Date. Solution - 2: A: OK, this is
not exactly going to be a solution, but it
might help. What you have is a sequence of
three XORs, then Windows 7 hashes the
entire file, and Windows 8 hashes the first n
bytes. These are clearly distinct images, but
the fact that the hashes overlap is probably

going to lead to some confusion. Windows 7 hashes both the original and the "salt", so, when Windows 7 hashes the file again, it compares the two hashes and knows it has arrived at a later version of the same file.

Windows 8 hashes the file as it is, and compares that hash to the file as it was on the day of release. Windows 7 will have seen the file on those two occasions, and will have verified that they are the same. Windows 8 will have seen the file on one occasion, and will probably not be sure that it is the same. I would think that both will be able to tell that

the files are identical, but it is still a risk, because there is no way to tell if the extra bytes that Windows 8 hashes are unique to that version. You have two possibilities: 1) Compress the entire RAR file and verify the result (via some tool which can't be cracked anyway). If it comes out equal, then you have a safe version. You'll want to unpack it first, before you do that. 2) Check that the first 512 bytes of the file are identical between versions (again, via a tool which can't be cracked). Probably 2) is a safer, but longer option. It would mean that Windows

8 would have to compare 512 bytes of the file, when it already has the hash of the entire thing. Depending on how the compression works, this could or could not end up with zero-sized files, so you have to be prepared for this to be an expensive comparison.) is created by // using // we will add our own additional annotations using the same name and // in an 3e33713323
