The software does not need any advanced knowledge from the user, even though it is possible to obtain additional information by clicking on the Help button. The interface of the program is quite

easy to use, and you can carry out the resizing operation in just a few clicks. The tool will produce an output file containing the necessary information related to the shrinking or expanding operation. The exported file will contain all the details about the shrinking or expansion operation. Among the information included in the file, you will be able to find out the size of the volume before and after the resizing process.

You can also see the amount of used space in the original volume before and after the resizing process has been carried out. Besides, the tool has the ability to export the information about the shrinking or expanding operation in a CSV (comma-separated values) file, which could be very useful for users that are going to use the file for some specific purposes. Another interesting aspect about the tool is that it is

quite easy to carry out the shrinking or expanding operation of a volume without having to log off. The whole process of resizing a VHD volume is extremely fast and it is possible to carry out the operation in few minutes.

However, there is no need to worry if you are not 100% sure about the size of the VHD file before starting the shrinking or expansion operation. Since the resizing process will start

automatically once the required space for the operation has been allocated, the task is completely ready to be carried out. The tool supports various operating systems, including Windows Server 2008, 2008 R2, 2012, 2012 R2, 2016 and Windows 10.

What's New In VhdResizer?

VhdResizer is a small and straightforward Windows utility designed to help users to shrink or expand the volumes of VHD files. It can be installed with just a few clicks and it should run without problems on pretty much all Windows versions supporting Hyper-V. To get started with the

app, users need to browse to the location folder of the VHD file. Next, users are required to choose the destination path for the exported file. Users can choose between two types of conversion (either dynamic or fixed). To complete the procedure, users are also required to choose the desired volume size (in MB or GB). The time of the resizing process is totally dependant on the computer performance and

the original VHD file's size.

Taking everything into account, VhdResizer is a very useful and simple tool for those situations that require users have to carry out the specific tasks of resizing the volume hosted in VHD files.
