GRBL is a G-code interpreter for Windows, Linux and MacOSX that will translate your G-code files to G-code that will be printed on a 3D printer. It works with many different types of 3D printers and print beds. If you already own a 3D printer and have g-code files, GRBL can read them directly. If you don't have a printer you can still create your own g-code files. Even if you don't have a 3D printer you can still use GRBL to simulate what your g-code would look like on a printer. More than a G-code interpreter, GRBL can also be used as a G-code creator. When creating your own g-code files you can create automated moves and cuts. The moves and cuts you create can be performed in a loop over a period of time. So if you are baking something, you can create your own batch recipes to automate the baking process. All these features come together in a fully featured, easy to use application. Once you have GRBL installed, you can simply start g-code interpretation with the Open Menu, and see how your g-code file would print. If you want to create your own g-code files for your printer, create your own recipes or edit existing ones, that is all done through the menus and dialogs of GRBL. Berenice is a 3D visualization tool designed specially for electronic printed boards design. It can take design made in Eagle or any other pcb tool and visualise, rotate, zoom, move and pick in nearly real world view. Berenice is open source and free (as in speech) software and can be used in education or company. It can be installed on any Linux platform (Ubuntu, Fedora, Mint, Debian, Fedora, Ubuntu, and Debian). How to Install? Please go to Berenice page and click on download link, or click on below link to my personal github repo : How to Use? Berenice is easy to use. Berenice is a fast and flexible PCB simulator which aims to provide a powerful, portable and free alternative for PCB design on Mac OS X. It features interactive 3D visualization, real world movements, easy to use interfaces and a large list of features. The program supports Eagle, KiCAD, Mentor, Altium and any board generators. Berenice can also be used to inspect your pcb (like with your microscope, but with better results) and to check your connections. It runs on Mac OS X 10.4 and up. Berenice requires Mac OS X 10.4 or later, and a working 3D graphics card for full 3D visualization. The Berenice display can be rotated and zoomed in 3D and also moved in real-world view. Some features of Berenice include: 3D View: 3D view of a board can be setup to include: All layers visible Textured walls of holes, vias, etc. Color coded regions Z-Axis scale of [-1, 1] Ground plane of [-1, 1] Open vias on/off Highlights of selected objects Board size for 2 layer boards: 16"x16", 24"x24", 32"x32", 40"x40", 44"x44", 48"x48" Board size for 4+ layer boards: 16"x16", 24"x24", 32"x32", 40"x40", 44"x44", 48"x48" Preview PCB: Rotation and Zooming: Rotation and zooming can be done with a gesture.
