The DWG format is a drawing format based on the Adobe Illustrator format. However, it uses a binary format instead of bitmapped files, resulting in more efficient storage. I've tried simply using \$VIRTUAL\_ENV as the source but it isn't in the correct location and also isn't using the correct python version. Is there any way I can point to the virtualenv directory? I can copy my virtualenv to the other directory if that's the only way... I'm running CentOS 6.3 I have virtualenv 0.18.2 and Python 2.6.6 A: So after some more digging, I found that it's possible to use \$VIRTUAL\_ENV without the need to access the python version and source dir, by using the \$base\_dir variable. It's not perfect as I need to restart my python interpreter, but it works for me for now. Inhibition of DNA-dependent protein kinase (DNA-PK) activity by ceruloplasmin. DNA-dependent protein

And finally, select Autocad from the program list, after activation, the option to start it. This invention relates to co-operative sorting of pieces of mail, such as letters, cards and the like, to separate out a particular group of these pieces. In an attempt to increase sorting speeds, it has been proposed to use optical readers which are arranged to read and identify any of the information provided on a piece of mail, such as an address, a zip code, a bar code and the like, by automatically accessing this information, to sort mail. One problem with this approach is that the postal service regulations provide a set of maximum lengths and girths for postal items, and these items are not necessarily within these ranges. Accordingly, conventional optical readers must be adapted to accept articles of greater length and girth. Thus, there is a tendency for the optical readers to become expensive, large and unwieldy. A further problem is that, unless means are provided for the co-operative sorting of mail pieces which are substantially the same length and/or width, differentiating devices must be provided for each particular size mail. It is an object of the present invention to provide an apparatus for the co-operative sorting of mail pieces which is inexpensive, small and can be used to sort a number of different sized mail pieces. Accordingly, the present invention provides apparatus for co-operating with a plurality of feeders, each feeder having an article delivery area and a key unit, for receiving the articles from the article delivery areas, for carrying out the following steps: (i) determining whether the length and/or width of each article is within predetermined size ranges, and if it is, operating a first key unit to carry out the following steps: (a) determining which of a plurality of keys corresponds to the length and/or width of each article; and (b) operating a corresponding key unit to carry out the steps; (ii) if the length and/or width of each article is not within the predetermined size range, operating a second key unit to carry out the following steps: (a) determining which of a plurality of keys corresponds to the length and/or width of the article; and (b) operating the corresponding key unit to carry out the steps; (iii) if the article does not carry the data required to identify the length and/or width of the article, operating a third key unit to carry out the following steps:
