Use of anti-tonicity management with sevoflurane anesthesia in an animal model of heart failure. Our previous study showed the antinociceptive efficacy of inhaled sevoflurane in heart failure rats. This study aimed to examine whether inhaled sevoflurane, as a sedation and analgesia drug, prevents/ameliorates the cardiac morphological changes and functional deterioration in heart failure rats. Moreover, we evaluated whether the antinociceptive effect of sevoflurane is reversible or is associated with the central action of the volatile anesthetic. We examined the effect of inhaled sevoflurane on the functional and morphological changes in rats with heart failure induced by transverse aortic constriction (TAC). Eight weeks after TAC, rats were exposed to 1.4% sevoflurane for 15 min without anesthesia. Changes in the heart rate and arterial blood pressure were evaluated during sevoflurane exposure. Cardiac morphological changes and the sympathetic nerve activity were evaluated after sevoflurane exposure. Sevoflurane exposure significantly decreased the TAC-induced increases in heart rate and arterial blood pressure. Sevoflurane exposure also prevented the TAC-induced left ventricular (LV) dilatation, cardiac hypertrophy, and increased sympathetic nerve activity. These sevoflurane-induced cardiac protective and antinociceptive effects were completely reversed by the intravenous administration of 300 mg/kg midazolam, a potent benzodiazepine antagonist. These results suggest that the antinociceptive efficacy of sevoflurane is related to its central and peripheral actions. Sevoflurane may be a useful anesthetic in patients with cardiac failure.
