The more you use your keyboard, the more you want to store its configurations, the more you want to be able to load its settings into memory, the more you want to be able to select your favorite macros for repeating a set of actions, or to be able to have a quick way to type a given set of keys. If you are looking for a tool that offers these features,

KEYMACRO is a simple yet very effective solution, especially if you are a command line aficionado. Intuitive, user-friendly, easily accessible In terms of design, you can trust that this piece of software is easy to learn, simple to use and pleasant to look at. Setting up the tool is quite straightforward, even though you may be surprised to find it not simply relying on command-line arguments, but rather on an interface window. Once set up, it will save your configuration and load the settings when it is launched. However, it would be nice to have the ability to save the settings without having to relaunch the program, so, as with any other software, you can simply load its configuration into your clipboard, then paste it when you need to have your keys in action. Take advantage of your favorite keyboard With KEYMACRO, you get a set of keys that can be either hotkeys or macros, which can all be set up individually or for each combination, although, unfortunately, they are only compatible with certain keyboards. If you have a keyboard that is not compatible, you will have to change the settings, but that's a pretty straightforward process. In addition to being a highly configurable tool, KEYMACRO boasts an informative help section, featuring a tutorial that is both helpful and easy to understand, as well as a comprehensive manual where you can view all the settings in detail. Programming is made easy KEYMACRO is supported by its user community, which has posted a lot of tips and tricks, such as those that

explain how to adjust the hotkeys, and then how to create a macro, but, most importantly, how to display its main functions, an issue that is more often than not overlooked in similar programs. One of its features that cannot be overlooked is the ability to edit the programs you have used in the past, allowing you to select, replace, and then load the program in memory, which will then use the older settings. The other reason why KEYMACRO is so great is that it allows you to access 1d6a3396d6

Image Hijacker is a unique piece of software that allows you to conceal your usage of certain tools on your computer. You may have seen the various video-streaming services that keep popping up, claiming to be able to record your actions in the virtual space and provide you with a wide range of other goodies. If you are familiar with these services, you should know that they are used by hackers for various purposes, but, unless you are willing to pay (and pay dearly) for those services, you will not be able to download the recorded material, thus ending up with a lot of 'time wasters'. The good news, however, is that there is a different kind of video-recording software that will allow you to record everything you want to record without the need to pay for additional service, as it simply offers you a way to record any programs you wish to. The program, known as 'RecordMyDesktop', is, by its nature, not a security tool, so you should only use it if you are absolutely sure that you are not about to violate the privacy of the people using the same computer as you. This is not a live-streaming utility, instead, it records everything that happens on your desktop, and then makes it possible for you to download and then, from there, share your recordings with anyone you please, or simply enjoy the recordings on your

own. Before you start recording, you have to select the desired recording format. This is done by picking the format you want to use for your recordings, and it offers the following options: Frames Per Second: you can choose between 30, 60, and 100 FPS, since 30 FPS is the best choice if you wish to record computer screen actions with a decent picture quality, while 60 FPS is slightly better, but with a slightly lower quality, while 100 FPS is the best for watching videos and for analyzing CPU load. Bitrate: this value controls how much information about the target application will be provided by the output recording. The lower this is, the more detailed the video will be, and thus, the higher the quality. However, the higher the value is, the higher the bandwidth and the better the compression is. Minimum Frame Duration: the minimum duration of frames in the recording is also selectable. You can also choose between 1 and 2 seconds. Unfortunately, the program does not record audio, so you will not be able to download your recordings for playing in a video-
