My goal with the overview is to give you the skills to get started with Photoshop, so that once you get more advanced, you can move along to more detailed tutorials focused on the uses of Photoshop. I did NOT intend for this overview to replace any tutorials that you may already be using or familiar with. It is intended as a basic outline to get you to start on your own with Photoshop. Only after you've learned Photoshop, and it has become more of a powerful tool in your arsenal, should you begin to move onto more in-depth tutorials. I'll be adding more tutorials and other resources on my blog over time, and I encourage you to check back periodically. You might find that some of the tutorials are helpful, and some might not be so useful to you; I'm not a professional; I've never been a professional. This overview is intended to act as a starter project for beginners. I'd love to hear what you think. Leave me a comment below. Thanks for reading! Photoshop, from Sketch to DPI In the world of graphics, every image starts as a sketch, a concept or idea that might be visualized in one form or another before being polished. Photoshop facilitates this process by providing a myriad of tools that transform that sketch into a final product. If you are a new user to Photoshop, you'll see that a number of separate tools are represented in the image above. The standard image can be created in Photoshop by choosing Edit > New > Photo. Cyclic AMP and protein kinase in neurosecretory cell neuroendocrine tumors of the lung. Normal rat lung tissue contains a number of nerve terminals and neuroendocrine cell bodies. Cell bodies and innervation by peptide-containing neurosecretory cells have been found in lung tumors, including small cell carcinomas, adenocarcinomas, and bronchial carcinoids of the lung. The parenchymal epithelium of the lung contains a mixture of hormones or peptides that have significant effects in the physiology and pathophysiology of the lung. As a result, neuroendocrine tumors of the lung can affect hormone secretion in distant organs in addition to producing their own peptides. The presence of peptides in the rat lung parenchyma by radioimmunoassay was investigated. In addition, the cell membrane-bound adenylate cyclase complex, the activity of cyclic AMP-phosphodiesterase, and protein kinase activity were measured in the isolated adenocarcinoma, large cell carcinoma, and small cell carcinoma cell lines. The presence of cyclic AMP was determined in the rat lung parenchyma. Adenylate cyclase activity, as measured by its ability to convert [32P]ATP into cyclic AMP, was demonstrated in high concentrations in the adenocarcinoma cell lines; the smallest cell line had twice the basal activity. Both large cell carcinomas contained high concentrations of cyclic AMP and low concentrations of cyclic AMP-phosphodiesterase activity. Adenylate cyclase activity did not correlate with protein kinase activity in either the cell lines or the adenocarcinoma. Large cell carcinomas were twice as sensitive to exogenous cyclic AMP as the adenocarcinoma, suggesting a possible mechanism by which the cell lines might synthesize and secrete physiologically active peptides.Hemophilia A is an X-linked bleeding disorder. It affects approximately 1 in 50,000 live male births. The number of hemophilia A patients is estimated to be about 200,000 to 300,000 in the world (Von Recolt et al., Hemophilia A and B: Current Concepts and Therapeutics. Clinical practice, 2007, 8(2), 43-51). Hemophilia A patients are often in their late teens or early adulthood, with an estimated mean age of onset of 15 years.

Let's say I have an object Foo that contains a property Bar public class Foo { public string Bar { get; set; } } I have a component container with a property reference (Foo) that is visible to consumers of the container component. public class Container { public Foo Bar { get; set; } } And there is a component that uses the container component, public class Consumer { public void DoStuff() { // What would the constructor of the Container component need to // so we can access Bar from the constructor? } } I'm wondering if it is acceptable to be passing around a reference to an object like this, because we are somehow circumventing what I'm calling the component layer: public class MainComponent { public void DoStuff() { // Do things } } public class Consumer { MainComponent mc; public Consumer(MainComponent mc) { this.mc = mc; } public void DoStuff() { // What would the constructor of MainComponent need to // so we can access mc.Bar from the constructor?
