Category: Programming languages Category: Dynamic programming languagesQ: Wrong Integer values to Float types are not Correctable during conversion in IntelliJ IDEA 13.1.3 I have encountered a strange issue in my current web project, in which the Integer values are treated as Float during conversion. I am using IntelliJ IDEA 13.1.3. I have a database which has been created in MySQL, and my website is built on Spring (using MVC). I can't change the Integer type into its float counterpart. The strange thing here is the conversion to float/double takes place in the list of values to be uploaded to the database. This is my conversion, where If_Gal_Lead.Overall_Weight_Percentage is an Integer type.
If_Gal_Lead.Overall_Weight_Percentage=Float.valueOf(float>If_Gal_Lead.Overall_Weight_Percentage); I want to convert this Integer into Float, but for this I need to change the type of this field. So I use Double.valueOf>If_Gal_Lead.Overall_Weight_Percentage). But this only returns as 0.0 when my value is 1. If I use If_Gal_Lead.Overall_Weight_Percentage, which is an Integer, then this will be treated as float and will return correctly as 1.0. This is a very strange behaviour and I am trying to sort it out. Any help will be appreciated! A: Check your locale setting. Make sure it has a decimal point. I faced the same problem. I set my locale to US and it was working for me. Also you can check this link for more detailed info. Well, the solution to my problem was to explicitly use the String instead of float. Q: Django reusable template for 'item in list' output I am trying to avoid hard coding my loop in the template where I have. {% for item in user_profile.avg_rating_all_products %} {% ifequal item.product_id profile.product_id %} {{ item.store_product }} {% endifequal %}
