== If you use the macro you should be aware that it will add two additional graphs to the report. The macro is set up to automatically determine the number of pages and sets the report parameters so it always fits the specified maximum width. It also detects the orientation of the sheet and sets the parameters accordingly. There is no need to adjust anything, simply press the button. You can also include the new files as an attachment. Limitations: ================ - The macro must be used to set the report properties, the reports cannot be drawn manually. - You can choose whether or not to export the properties and the graphs. The properties are not exported if you choose to export the graphs. - You must save a copy of the default.xml file. You can then modify it to suit your needs. - The macro does not recalculate the report if the sheet is changed. - The macro does not modify or add to the existing reports, it creates new ones. - The macro has been created to work with Microsoft Works and will not work with Apple Works. - The macro runs from the WORK.DAT file or from a file containing the macros. For example, you could insert the macro in a worksheet or in the report properties, but not in the main body of the report. If you are using the macro you must edit the default.xml file and remove any default properties or save them in a different location than the worksheet. If you are using the macro to create multiple reports from the worksheet, you must also add the macro to the main body of the report. The default.xml file should look like this: If you are using the macro to create a 1d6a3396d6

Slope software, produced by the American slope stability expert company "Computer Code Systems" is a software which provides engineers and scientists with the information needed to accurately determine slope stability. Slope software is designed to help the users determine the parameters necessary for the most accurate slope stability analysis. Slope is a powerful program that is ideal for analyzing and displaying the results of many slope stability investigations. Slope is a software package developed in Delphi by the American slope stability expert company, Computer Code Systems. Slope offers engineers the tools necessary to determine parameters for various slope stability investigations. At the core of Slope, lies the slope stability method, a strategy for determining a slope's stability and safety. The slope stability method determines whether a slope will remain stable when subjected to a particular loading condition. Slope utilizes the principle of Bernoulli's equation to determine a slope's stability. To apply the slope stability method, the program loads a slope model that represents the slope in question. Slope is a software package designed for the geotechnical engineer or scientist. Using the slope stability analysis, the engineer can find design criteria for slopes and determine the stability of the slopes. Slope is a powerful tool designed to analyze and display the results of a wide variety of slope stability investigations. Slope software allows the user to load a slope model and analyze the slope to determine if it is stable or not. Slope has been used for a wide range of slope stability investigations, including the stability of existing slopes, the stability of an existing slope that is being constructed, the stability of rock slopes around a mine shaft, and the stability of a new slope to be constructed on existing terrain. Computer Code Systems developed Slope to provide engineers and scientists with the tools necessary to determine the parameters necessary for the most accurate slope stability analysis. In order to analyze slope stability, Slope requires a slope model to be loaded. Slope provides many of the necessary data input parameters, but each user will require the ability to load their own input data. Slope can be used to perform slope stability investigations of slopes of various sizes. These investigations can include large-scale slope stability evaluations of existing or planned slopes, as well as small scale slope stability analyses for single slopes. Slope can analyze the stability of existing and planned slopes. Using this information, engineers can determine if existing slopes are properly designed and constructed to be safe. If the slope is being constructed, engineers can use the slope stability analysis to determine if the construction is safe. Slope can determine the stability of existing slopes to support a particular load, or it can calculate the stability of a new slope to be constructed to support a particular load. Slope software provides engineers with the necessary tools to perform slope stability investigations on existing and planned slopes. Slope has been used
