This is a simple free tool to help estimate the break-even point of your small business with any investment, salary or savings forecast you choose. The main input is an online business plan. Note: I test it on large sites; it works perfectly. How it works: The free Small Business Break-Even Analyzer tool is based on the financial logic of the Graph of the Exit Strategy. The small business break-even point is a line or curve on the graph that the business plan matches by the time. The break-even point is the intersection of the early investment line and the business start-up line. Once a point on the early investment line, the "Return on investment" (ROI) line starts at a large value at the start of the business. The Business Plan: Put details of your business into a plan (you can do this online or offline) Start-up Investment ($) Salary ($) Salary ($) Salary ($) Rental ($) Rental ($) Rental ($) Purchase ($) Purchase ($) Purchase ($) I/O ($) I/O ($) I/O ($) Start-up Sales ($) Total Sales ($) Return on Investment ($) Balance Sheet Depreciation ($) Depreciation ($) Depreciation ($) Note: An online business plan will work well Initial Investment Launch Time Entry Point ROI Line JTX Get a free tool to help estimate the break-even point of your small business with any investment, salary or savings forecast you choose. ================== The tool uses the "Return on investment" line.
