Mod for Shadowrun Returns. The ShadowrunFabrication and characterization of a novel polyoxometalate-based anionic molecularly imprinted polymer. An anionic molecularly imprinted polymer (AMP) with polyoxometalate functionality (POM-AMP) was fabricated and characterized. The antimony(V) selenide (Sb(V)Se) or antimony(III) selenide (Sb(III)Se) perovskite (POM) was used as a functional monomer. Pluronic F127 was used as an anionic template and sulfobutyl ether- $\beta$ -cyclodextrin (SBECD) as a swelling agent. The template was effectively removed using ethanol. The morphology and binding capacity of the resultant polymeric system were investigated using SEM and XPS, respectively. The binding kinetics of Sb(V)Se was analyzed using molecular modeling. The binding model of the Sb(V)Se (POM-AMP) was proposed based on the results of XPS, SEM, IR, and kinetic studies. The Sb(V)Se POM-AMP showed high selectivity for Sb(V)Se in comparison with other metal ions, such as Bi, Zn, Mg, Pb, Cu, As, and Ag. The Sb(V)Se POM-AMP can be used to selectively extract Sb(V)Se from seawater. The present disclosure relates generally to a method and apparatus for processing a signal, and more specifically, to a method and apparatus for processing a signal using a phase programmable offset pulse circuit. Conventionally, offset pulse circuits have been widely used to precisely select a delay time and/ f30f4ceada
