In Photoshop there are many functions like color adjustments, coloring and brightness, multiple selection, merging, etc. that makes your work easier and save time. There are also a lot of interactive features in Photoshop, like the paint bucket, smart selection, the brush and the airbrush. There are also some advanced and unique features that you can't find in other software, like the Healing Brush, Warp and Liquify tools. Adobe Photoshop The best part of Photoshop is that it is an all-in-one editing tool, it provides many features that you may need at any time. With Photoshop you can quickly create an abstract image, convert a JPEG into an image, or remove noise from a photo. The software also has many predefined effects that will help you to solve problems. It has masking capabilities, brushes for retouching, adjustment layers and filters. While the software has many useful features, like the easy to use tools and the predefined effects, there is a simpler and easier way to edit your photos, and this is where Photoshop Elements comes in. The free version of Photoshop Elements contains some basic tools, like the basic tools, the paint and markup tools, and the photo organizer. This is easy to use and navigate, but it is lacking some features found in the full version of the program. However, it's better than nothing! As you can see, Photoshop Elements is a complete replacement to Photoshop but the features and pre-made effects are limited. Some common uses of Photoshop Elements are to edit photos, create graphics and memes. Pros When you edit a photo in Photoshop Elements, you can perform a range of editing and adjusting tools, such as the ability to crop, change colors, resize images and much more. It also has a powerful selection tool that is able to accurately select multiple portions of an image. It has a diverse selection of effects. You can apply Photo filter effects or adjust the hue, saturation and brightness of the image. You can create a stunning typographic effect. Photoshop Elements is a cost-effective software. It is free to download and is well suited for personal use. Adobe Photoshop Elements You can easily do your work with Photoshop Elements, and you can also save time and money since this tool is free. Q: A generalized root test with no real roots I have the following question which is supposed to be solved using the Alternating tests. Let $a,b,c \in \mathbb{R}$ be such that $ab(a-b)+(bc-ca)(c-a) eq 0$. Consider the polynomial $f(x)=ax^2+bx+c$, a) If f has a real root, prove $ab(a-b)+(bc-ca)(c-a)=0$. b) If f has no real root, prove that $abc eq 0$. I have no idea how to approach this question. Thanks for help. A: In terms of the coefficients, the polynomial f is $(a-b)^2+2(b-c)^2$. If $ab(a-b)+(bc-ca)(c-a)$ is 0 then so is $(a-b)^2+2(b-c)^2$. We're going to use the algebraic identity $$ (a-b)^2+(b-c)^2+(c-a)^2 = 3(ab+bc+ca) $$ (which comes from the Pythagorean Theorem). This identity gives f a coefficient $3abc$. This is a contradiction, since it gives a real number, and f is assumed to have no real roots. Therefore, $ab(a-b)+(bc-ca)(c-a)$ cannot be 0. A minor remark: $\frac{abc}{a(a-b)+(bc-ca)(c-a)}$ is not real. Q: How to ignore erroneous servlet requests in XMLHttpRequest I am using ASP.Net MVC and XAMPP to implement a very simple web application. My Web Application makes basic GET requests to the server for multiple independent reasons. When I set the POST parameter in the header to include a request (via a simple POST request) with some error, I get a 404 error back from the server. If I remove the request, I get my normal 200 OK return from the server. So the problem is that the server is being passed a request that the server recognises as an error, while the client is recognising the request as valid. This causes the client to be unusable, as it throws an exception before successfully loading the result from the server. So my question is, can the server somehow be taught to just ignore an incoming request with an error? The web request I want to ignore is from a servlet in a Spring framework and I am currently using the Spring MVC framework. The errors occur on the client side before the servlet is loaded, so I can't figure out how I can do this. The servlet in question (i.e. the one throwing an error): @WebServlet(name = "MyServlet", urlPatterns = {"/MyServlet"}) public class MyServlet extends HttpServlet { private static final Logger LOG = Logger.getLogger(MyServlet.class); @Override protected void doPost(HttpServletRequest request, HttpServletResponse response) throws ServletException, IOException { try { response.setContentType("text/html;charset=UTF-8"); PrintWriter writer = response.getWriter(); writer.print("Hello, world"); } catch (Exception e) { LOG.error(e.getMessage()); } } } When I try to execute this servlet via a GET request, I get a 404 error. The request parameters are: OPTIONS /My
