You can also edit images directly in GIMP, which is generally considered easier to use. You can find instructions for using GIMP on the GIMP website, [_www.gimp.org_](http://www.gimp.org). ## Using Backgrounds and Overlays The elements of the basic building blocks of a digital image are the `_background_` and the `_foreground_`. The `_background_` is the part of the image where the picture is. It can be solid color or it can consist of anything the user can add or subtract. `_Foreground_` is anything you place between the subject and the background. The `_background_` is a drawing over an image that you create in the computer, or you can choose an image that's already loaded on the computer, such as one of the images in Figure 10-1. You can add layers — each layer has a distinct foreground and background color and image — and put pixels in places of your choosing, as seen in the next steps. The final image shown in Figure 10-1 has five layers. The image inside the overall background layer is the original image with its color and shade; the middle ground layer is transparent and allows the colors in the main photo to shine through; the foreground is a layer with a blue blue-and-white striped background; and the foreground photo is a thin layer of white. Figure 10-1: This image has three layers: the main background with a photo of the courthouse inside a transparent layer, a blue-and-white striped layer, and a thin layer of white in the foreground. To manipulate the background and foreground and add objects to the picture, you need to draw on a new layer — created by creating a new layer or by clicking the Create a new layer button on the Layers panel. You have several options for layers and objects that you place on layers. The next steps show you how to change the color of the background and foreground and add objects to your image. Follow these steps to begin working with a new layer: 1. ****Save the image you want to edit.**** Photoshop saves your file as a .psd file. 2. ****Open an image in Photoshop.**** Use any of the files from the first exercise in this chapter. To open an image in Photoshop, click the Open button in the Application Bar or the Image menu. 3. ****Click**

Photoshop Elements 2019: What's new? If you are curious about the new features in Photoshop Elements 2019, here are some of the highlights: Interface The user interface in Elements 2019 was streamlined to make it easier to find and work with the tools you need in a variety of tasks. Tools The 16-bit RAW image editor is the original tool for those with deep experience in using RAW editing tools. The basic RAW editor is the foundation for the other tools that support this format, including: The 16-bit RAW Converter (formerly called Smart Converter) lets you convert 16-bit RAW images to 32-bit JPG, TIFF, or PSD and to 16-bit TIFF or PSD. The 16-bit RAW Editor lets you view and make adjustments for 16-bit RAW images. The 16-bit RAW Fixer lets you correct 16-bit RAW files with black-and-white and color correction tools. 8-bit RAW image editing is supported for 8-bit JPEG, 8-bit TIFF and 8-bit PSD images. You can use the basic tools to perform basic correction, then use the specific tools for fine-tuning. The 16-bit RAW Converter doesn't directly import or export to 16-bit RAW images. But you can use it to quickly convert 16-bit RAW images to 16-bit TIFF or 32-bit PSD. Batch conversion of 16-bit RAW images to 32-bit TIFF and 32-bit PSD: To perform batch conversion of 16-bit RAW images, go to File → Conversion → From 16 bit RAW. You can pick the output format as JPEG, TIFF or PSD. Then you can choose what tool to use to perform the conversion. The options for the conversion are either 16-bit RAW Converter or 16-bit RAW Editor, so you can use either to convert the images to JPEG, TIFF or PSD. Note: Batch conversion works only for RAW images, not JPG images. 8-bit RAW image editing is supported for 8-bit JPEG, 8-bit TIFF and 8-bit PSD images. You can use the basic tools to perform basic correction, then use the specific tools for fine-tuning. The 8-bit RAW Converter lets you convert 8-bit JPEG, 8- 05a79cecff

et quelques coussins! (L'Oranais) SUCH A LITTLE PROMETHEUS such a little angelQ: How can I re-order a block of code to match another block of code in Mathematica? I've got two blocks of code that I want to be able to match up like this: Block 1: $\text{Integrate}[2*a*(2*b*x - 3*y - 1)* E^{(-(2*b*x - 3*y - 1))^2}, \{y, 0, \text{Infinity}\}, \{x, 0, 1\}]$ Block 2: $\text{Integrate}[2*c*(2*d*x - 3*y - 1)* E^{(-(2*d*x - 3*y - 1))^2}, \{y, 0, \text{Infinity}\}, \{x, 0, 1\}]$ The trouble is that Block 1 is dependant on the definitions of Block 2, so I can't just re-arrange the order of the blocks. How can I re-order the integrals so they match? I'm afraid this isn't a Mathematica question, I'm just hoping someone here will be able to help. A: There is no good solution. Here's an attempt to generate a version of the function that can be compared to the source. I have removed the definitions of c and d so that the two problems are totally independent. $f[t_] = \text{Integrate}[2*t*x*t*y*E^{(-(2*t*x + 3*y + 1)*t)^2}, \{y, 0, \text{Infinity}\}, \{x, 0, 1\}]$ $f[2] \text{ 1/4}$ We can now make a fake version of c and d that looks like it comes from Block 1: $g[t_] = \text{Integrate}[2*a*(2*b*t*x - 3*y - 1)*t*E^{(-(2*b*t*x - 3*y - 1)*t)^2}, \{y, 0, \text{Infinity}\}, \{x, 0, 1\}]$ The two functions can now be compared: $g[2] == f[2]$

Q: Renaming commands for HTTPS public access I'm looking for a way to allow my sites to be indexed by Google and Yahoo without having to use the same domain for the public and private portions. I already have my own DNS setup to redirect requests to my private IP address for www.mydomain.com. Now I want it to redirect requests for .com to my

www.mydomain.com, and do so for both HTTP and HTTPS. Is this possible to do on either side of the redirect using Apache?

A: If your Apache is configured to serve HTTP and HTTPS simultaneously it should be fairly straightforward. Here's a config that I used (only a snippet): `RewriteCond %{HTTP:X-Forwarded-Proto} ^https RewriteCond %{REQUEST_URI} ^/myfolder RewriteRule (.*) [R=301,L]` The first condition has a trailing ^ to ensure that it applies to ALL HTTP requests, not just ones that use HTTPS protocol. The second condition ensures that the resource, /myfolder, is served by HTTPS only, and not HTTP. The third condition is where Apache does the actual forwarding. The fourth condition is to force a 301 (permanent) redirect instead of a 302 (temporary) redirect. As you know, the "EnronOnline" name and logo have been discontinued. We have made every attempt to find a company that can appropriately replace the EnronOnline name and logo, to provide a visual brand that will help in building our business and attracting quality customers. Unfortunately, we have only been able to find one company that has the ability and experience to develop the merchandise. We regret that we have been unable to meet with all of you at the same time. Throughout this transition period, we have great respect for the incredible accomplishments of the EnronOnline team members. We would like to use this opportunity to thank you all for your contributions to this great success. Please join us in thanking all of the EnronOnline team members for their hard work and dedication to Enron. We look forward to working with each of you in the near future. Thank
