1. How to Use the Layers Panel After opening a new file, choosing "Document" from the File menu and then clicking "New," a new document opens containing the blank slate for your image. It's made up of what's known as a workspace, a floating window where all the image's elements are displayed for you. To add a new layer, click the "Layers" menu at the top of the workspace, and then choose the "Layer" menu item. This will open a new panel listing the available layers you have added to your image. Each layer is a collection of pixels, which Photoshop calls a "raster layer," and the more layers you add the more you'll see in a specific area. To adjust the opacity of a layer, click on the drop-down box that's next to the layer in the Layers panel. This can be used to set the opacity of any layer to a percentage, like 50%, or any value, such as 100%. Layers that are completely opaque are 1.0 in the opacity box, while layers that are completely transparent are 0.0 in the opacity box. Once you've opened a new image, the following basic steps will help you create a new layer and lay it over a current layer. Select the layer you want to add the new layer to. Then, choose "Layer > New > Layer From Layer." You will see a new layer that's named "New Layer" and you can rename it something to help you remember it's purpose. Now, you'll have a layer available that you can add text or other items to. In this example, a new layer is added to an existing layer so that it's on top. Choose "Layer > Layer from Layer." 2. Using the Layers Panel to Edit an Image There are many ways to view and edit an image in the Layers panel. One of the most useful is the "Layer Stack." It's a container that contains all the layers in your image. For example, you can use it to select layers, or hide layers by turning their visibility on and off in the Layers panel. Sometimes you may want to temporarily hide the layers in your image, or "lock" them. This allows you to quickly change an element in the layer stack, but it won't change anything in the underlying layers. To lock a layer, select the layer and choose "Layer > Lock Layer."

We have a JSON object in the DB with a lot of different values of the same type. Is it possible to modify these values without knowing the exact location? Example: Type: NUMBER If I knew the location of the value I would do: UPDATE json_data SET numbers.numbers=[100]; Is there a way to modify all of them at once? A: Not if you're using plperl or plperl. But you can use Perl's DBI library to process the JSON string. You should be able to do it like: `#!/usr/bin/perl my $json_str = do { local $/; }; my @results = $dbh->selectall_arrayref(' SELECT j->>'. $data_field_name, 'json_each_text($1)' FROM (values({numbers: 42})), ('{numbers: 42}')) AS t(data) CROSS JOIN LATERAL json_each_text(data) AS j('numbers', 'NUMBER'));` The results will be: # interpolation: 10 # array: 42 Note that SELECT j->>'. \$data_field_name, 'json_each_text(\$1)' may expand when you use CROSS JOIN. You might need a join SELECT j->>'. \$data_field_name,
