This technology is a huge step forward in our ability to analyze and make sure that the game is fun, realistic, and balanced. We have built a brand-new, intuitive control scheme that takes advantage of this data-driven physics engine. Combining all these features is what creates the experience of FIFA Soccer on new level. Gameplay The control scheme that the whole team tested at the E3 exhibition was without a doubt the most polished version we have ever developed. The system design not only added a new gameplay dimension, but also improved gameplay in all areas, including dribbling, running, ball control, passing, shooting and defending. The most important aspect of the control scheme is its ability to read the player's body movements in real-time. FIFA's control scheme combines many elements of various soccer playing styles such as American baseball and Hockey, and while it is not possible to exactly copy these styles, we have put great efforts to achieve the most realistic gameplay, including a unique passing direction and a new dribbling movement. When executing a dribbling move, players will feel the appropriate resistance from the environment and also have the ability to see where opponents are, just like in real football. This also gives players more options on how to perform a run in the final third of the pitch. The new pass release technique adds a new dimension to the game play where players must learn to release the ball quickly in a set moment after receiving a pass. This is a very important aspect of the game which creates a more unpredictable game play. Another improvement in dribbling is that the new system allows for more complex runs where players can use the ball and the pitch in parallel. By this means, players can combine their body movements with the ball, and their opponents will not have enough time to react to the change. Attacking: With all these movements and passing options, FIFA Soccer offers more tactical freedom than ever before. Players can play the game how they want with more confidence and control. The new system gives players more options to dribble through specific opponents (the diagonal pass might be able to cut off the opponent, while the original system might be more effective in other situations), and more control of how they perform a run. For example, a player that prefers to dribble through an opponent with a twist can do so. This combination of movements is very different to the previous FIFA Soccer

To accurately simulate free kicks and penalties in play mode, we've added balancing algorithms to simulate the slight curve when kicking towards goal. Match Officials will also now cheer for their favorite team and opponent when they spot crucial moments in the action. The data we've collected over many years of football matches also helps to tell the difference between a good and bad penalty kick by checking the angle of the ball.**
- **The newest FIFA scooter is available and is now the most realistic version of its kind; you can now adjust its speed, power, stability and so much more. This new scooter also gives you new opportunities as you can earn championship medals for your favorite team by heading balls in the goal.**
- **Advanced AI simulation allows AI players to perform physically realistic actions. The new AI rewards players by challenging them to take difficult free kicks, and provides options for them to play creative, intricate football.**
- **The Impact Engine adds a feeling of speed and agility to a player's run as the player's contact with the ground is more realistically recreated using high-resolution mesh models.**
- **"Replay Assistant" gives you the ability to speed up or slow down a specific part of a match by taking it out of the normal forward motion of the game. The faster you play, the more realistic the game will feel.**
