Adobe Photoshop's revolutionary drag-and-drop tools make it one of the most powerful application for online graphic design. Components of Photoshop To fully understand the usefulness of Photoshop, it's necessary to understand the format of images it edits. For this purpose, Photoshop has five main components: Files—The image files that you edit and design Layers—Layers in Photoshop are designed to organize your image into sections and groups. Channels—The channels are the individual colors of each pixel in a raster image, such as red, green, and blue. Paths—The paths are tools in Photoshop to connect one raster element to another, usually to create shapes, which can then be retouched. Brushes—The brushes are tools that allow you to duplicate, move, resize, and manipulate raster elements. After you become comfortable with these areas, you can start your photo editing journey using Photoshop. To open the channel in question, simply click on it and the tools will be displayed. Each color channel has its own options and tools, but here are a few of the most common tools and settings you'll find: Change saturation (lightness or darkness): The saturation slider allows you to change the lightness or darkness of a color. You can also adjust the "saturation" slider to control the levels of saturation. Clarity: This adjuster lets you increase or decrease the overall contrast in your image. Brightness: This control makes your image brighter or darker. Contrast: Changes the overall contrast in your image. Curves: Changes the overall intensity or brightness and intensity of the image. Hue: This tool lets you change the hue (the color) of your image. Reds: This tool lets you change the red, orange, and yellow colors in your image. Greens: This tool lets you change the

This article will guide you through each of the main features found in the Photoshop Elements application. To go to a particular section, click on the number in the left-hand sidebar. Filter - Filter is the way to change the color of the colors in the image, the alpha channel, soften features, blur a feature or make it sharper, and several other operations. This is where you'll find a number of the most often-used effects, including a Color Mixer, a Color Burn, Dodge, Burn, Blur, Sharpen, Sepia and several other filters. You can apply these filters to any image in the following way. To select an image, click the left-hand folder icon, or select the image from the Drive window. Click Filter on the top bar. Click Filter, and use the tabs on the left to select the effect type you want. Hit the Apply button to apply the filter. The image is changed in the Image window. The text can be edited, changed to another font, or formatted using an Indent or other feature. The individual properties can be adjusted by simply going back into the Window. You can also use the text tool to create new text. You can add text to a new layer. At the bottom of the Window, you can manage your layers, switch between them and arrange them. When you place a layer on a new or existing image, the layer is placed over the image, and only appears on the layer. Here is the order for the top-most layer. Text - The text layer is there so that you can make changes to the text, adjust the font, style and color. Grayscale - This is a black-and-white image, where everything is painted in just one color. Invert - Inverts the image, and changes all the colors to shades of gray. Blending - Blending can be used to set the tonal value in the image. You can use it to enhance contrast, create special effects or make certain areas lighter or darker. You can also use it to create a softer, more balanced image, or to achieve a specific look or feel. Opacity - Opacity can be used to set the opacity of an object. This property is useful when you want to make an object appear to be partially transparent or solid 388ed7b0c7
